Supplementary material for

CLAMP: Fairness-Constrained Federated Graph Learning from Validated Sums with Private Group Statistics

Quang-Vinh Dang, Ngoc-Son-An Nguyen

S1. Full results of the main comparison

Table S1 extends the main comparison with the backbone of each method, the hard demographic-parity gap at threshold 0.5, the equal-opportunity gap, the record $\lambda^{(R)}/(\eta R)$ of the dual update for the CLAMP variants, and the number of seeds whose test gap is within the budget $\tau = 0.03$.

Table S1: Full main comparison, mean±sd over seeds, for all datasets and methods. DPD (soft) is the demographic-parity gap of the scores; DPD (hard) uses a 0.5 threshold. Cert.: $\lambda^{R}/(\eta R)$ for the CLAMP variants. Backbone: GCN or GAT as in the method definition, own: the baseline's own architecture. Degenerate runs (AUC near chance) are included.

S2. Update attacks, all attacker counts

Table S2 reports all attacker counts $f = 0, \ldots, 4$ with standard deviations over three seeds ($K = 10$ clients).

Table S2: Full update-attack results, mean±sd over 3 seeds, K=10 clients, for every number f of Byzantine clients. †: median, trimmed mean and Krum inspect individual client updates and cannot run under secure aggregation.

S3. Privacy budget and release period on the small graphs and Bail

S4. Privacy budget with a binding budget on Bail

S5. Ablations

Table S3: Privacy: utility and fairness against the statistics budget ε and release period P. $\varepsilon = \infty$: statistics noise off, default period (P=10 for German, NBA and Facebook, P=1 for Bail). mean±sd over 5 seeds. Fallback: number of seeds with no eligible feasible release after the warm-up, so the last model is reported.
